

# Insight enhancement: Create contact/account data report based on Eloqua "views"

---

Dear Oracle Eloqua,

Sometimes i produce reports for shared lists or contacts for my end users, and quite often they want the exact same amount of fields that are in their view (each business unit has their own view of the data they wish to see).

It would be ideal to be able to import fields into a newly created report based on views. If i assume correct, a view "hails" contact fields from the database to show, perhaps it's an idea this data of what field id's could be extracted and/or synchronised with Insight.

Kind regards,  
Robert Nagelmaker.
